

India - Climate, Vegetation and Forests

Chapter 3: India - Climate, Vegetation and Forests · Topic 1

Key Concept

India's climate is influenced by the monsoon, altitude, and distance from the sea, creating diverse regional weather patterns.

Vegetation types include tropical rainforests in high-rainfall areas, deciduous forests in moderate-rainfall regions, and thorn scrub in dry areas.

Forests provide important resources like timber, medicinal plants, and habitat for wildlife, while also helping regulate climate and prevent soil erosion.

Deforestation and forest degradation are ongoing concerns, making forest conservation an important priority for India's environment.

Quick Revision Notes

- India's climate is influenced by monsoon, altitude, sea distance.
- This creates diverse regional weather patterns.
- Vegetation includes rainforests, deciduous forests, thorn scrub.
- Rainforests grow in high-rainfall areas.
- Deciduous forests grow in moderate-rainfall areas.
- Forests provide timber, medicine and wildlife habitat.
- Forests help regulate climate and prevent erosion.
- Deforestation is a major conservation concern.

Practice Questions

- 1 Discuss India's climate diversity.
- 2 Name three vegetation types in India.
- 3 Research a forest resource, like timber.
- 4 Discuss why forests help prevent soil erosion.
- 5 Research a cause of deforestation in India.
- 6 Create a map showing India's vegetation zones.
